

Density explains only part of the geography of vote concentration

Residual HHI after a descriptive département-level regression of HHI on log population density, 2022.

OLS over the 96 départements: $HHI = a + b \cdot \log(\text{density})$, $R^2 = 0.35$. Residual = observed – fitted HHI. Descriptive, not a causal adjustment; the clusters largely follow candidates' strongholds. Sources: Ministère de l'Intérieur (first-round results), INSEE (population, surface). 96 metropolitan départements.
